

0.1 Brainstorming

0.1.1 1 Meeting

Time frame: 22.09.2015 17:00-21:00

Preview: Since this year FTC rules were published, every member of our team had carefully read them. Today we gathered together to discuss all the aspects of this year gameplay and think of how to get on with the most significant features of the game.

General aspects:

Features	Solutions	Label
Moving to the ramp is essential if we want to achieve high score.	We need to realise the wheel base that will be good at moving on the ramp.	chassis
The it will take a lot of time to climb to the 3-rd zone of the ramp.	We can deliver debris to the highest goal with elevator instead of climbing in driver-control period.	elevator
Space between each two bars in 3-rd zone is wider than the standard TETRIX wheel diameter.	We can use tracks or 3-4 wheels from each side of the robot in order to not to get stuck.	chassis
Goals for debris have a very little capacity.	It is more preferable to collect cubes than balls. That's why we need mechanism to prevent balls from collecting.	gripper
Pulling up costs 80 points. It's not difficult to realise then.	We need to spend at least 1 DC motor for pulling up. We can grasp the pull-up bar with hook and lift to it by reeling the cable.	pull up
Moving over the inclined plane and pulling up require high moment on motors. However, the number of motors is limited.	Our robot should be light enough to decrease the moment required for moving and, as a result, increase speed of moving.	weight
It's quite inconvenient to exchange ramps with your ally during the game.	We will negotiate with our ally about spheres of influence before each game. We need to make two autonomus programs for climbing onto both ramps.	strategy
Robot can grip 5 debris at once, when the maximal capacity of one bucket is 24 cubes. So, to fill one bucket robot has to repeat collecting and taking cubes to the goal 5 times per 1,5 minutes	We can make gripper for debris at the front side of the robot and extract scoring elements from the back side. It will allow us to go to the ramp backwards, so we won't need to turn around on the ramp before going down to collect debris and save time.	concept
All the zones of red alliance are the mirror reflection of blue alliance's zones.	Our robot should be symmetrical and capable of playing on both sides of field.	concept
This year autonomus period has no difficult tasks. The only hardness is that both robots in alliance have to fulfil the same tasks at the same place. Furthermore, robots can start autonomus period from different positions. So, it's difficult to predict how the another robot in our alliance will move.	We need to make a number of programs for autonomus period from different positions for easier adjustment to the ally's strategy.	strategy
It's not restricted to collect debris in autonomus period.	We need to realise automatically collection of 5 cubes in autonomus period. At the conclusion of autonomus period the robot will remain on the ramp with 5 cubes and we will put them to the goal immediately	strategy

The main conception of engineering process: FTC rules have a various number of heterogeneous objectives. Some of them are simple, while other are quite challenging. The quality of performance in same tasks depends on laboriousness of realisation of mechanisms.

In these conditions, we made a decision to develop two versions of robot:

1. a simple, but reliable one, to startup and perform in regional competition
and
2. a high-quality one, which will take a lot of time to design and assemble to perform in further competitions.

Detailed explanation:

1. Detailed explanation of robot...

Рис. 1: robot

2. Detailed explanation of program...

Рис. 2: robot

Additional comments: For the next meeting we need to think of two issues:

1. which tasks our simple robot should be able to execute without loss of efficiency
and
2. to set the priorities of performing tasks during the game.

0.1.2 Strategy discussing (22.09.2015)

Time frame: 22.09.2015 17:00-21:00

Preview: Today we put the priorities during the building of the robot and performing tasks of the game.

Detailed explanation:

1. The tasks which robot must complete (We assume that robot can do everything. Tasks located in order of priority) :
 - 1.1. Autonomous period:
 - 1.1.1. Push the button and score climbers. It give 60 points (20 - button 10x2 - climbers in autonomous 10x2 - climbers in tele op).
 - 1.1.2. Ride to opposite mountain and collect balls and bricks. It help us to save a time because when start tele op we already have 5 bricks.
 - 1.1.3. Go to middle or high zone of the mountain. It give 40 points. In addition we start driver control period near the top box. So we can put 5 bricks here immediately.
 - 1.2. Driver control period:
 - 1.2.1. Put elements that we collected in autonomous period to the top box.
 - 1.2.2. Go from the mountain and collect 5 bricks. We decided to collect only bricks because the balls take up much space in the box. So if we collect only bricks we can put more elements to one goal and get more points.
 - 1.2.3. Put 5 bricks to the top box. After that the top box most likely will be full. So we won't be able to put another five bricks.
 - 1.2.4. Collect and put 5 bricks to the middle box.
 - 1.2.5. Start moving to the crossbar and score climbers.
 - 1.2.6. Turn clear signal.
 - 1.2.7. Pullup.
2. Implementation of robot that can perform next tasks (tasks are in order of priority)
 - 2.1. Stable scoring to the middle box. This task is very simple and give a lot of points.
 - 2.2. Scoring to the high box. This task is more complex but is give more points.
 - 2.3. Scoring the climbers in driver control period. We can do it very fast and get 60 points but for scoring the top climber we must be able to climb to high zone.
 - 2.4. Scoring climbers in autonomous period. It is very easy task that give 40 points (as 4 bricks in the middle box).
 - 2.5. Riding to the high zone. It can give 40 points in autonomous period and 40 points in tele op.
 - 2.6. Pulling. This task give the most points.
 - 2.7. Turning clear signal. It give us 20 points and our opponent lose 20 points.
 - 2.8. Pushing button. This task is difficult in terms of programmeing and give only 20 points.

Task for the next meeting: to elaborate concept of the robot.

0.1.3 3 Meeting

Time frame: 23.09.2015 19:00-21:30

Preview: The main purpose for current meeting was to figure out how the modules of simple robot should look and how they will be developed.

Modules:

Modules	Solutions	Label
Wheel base	We will use 8 standard wheels with 6 DC motors.	chassis
Elevator for debris	We will use the crank elevator with one degree of freedom.	elevator
Bucket for debris	We will create bucket for collecting only cubes without any active grippers e. g. rotating blades.	bucket
Slopes for collecting debris	We will put slopes on both sides of the bucket to increase collecting area	gripper
Heaviness	We will build as light robot as possible to afford gear for speed 2:1 on drive motors.	wheel base

Detailed explanation:

1. Detailed explanation of robot...

Рис. 3: robot

2. Detailed explanation of program...

Рис. 4: robot

Additional comments: For the next meeting we need to consider the high-quality robot's modules.

0.1.4 Concept discussing (24.09 - 27.09)

Time frame: 24.09 - 27.09

Preview: The main purpose for current meeting was to figure out how the modules of high-quality robot should look and how they will be developed.

Modules:

Modules	Solutions	Label
Wheel base	Six standard wheels	wheel base
Lift	Retracktable rails	lift
Gripper	Rotating brush and bucket	gripper
Scoring autonomous climber and pushing button	F - shaped beam	climbers + button
Scoring climbers in tele op	Retracktable slat	climbers
Pulling	Motor that reel the rope	pullup
Push the clear signal	Servo with beam	clear signal

Detailed explanation:

1. Wheel base will consists of six standard wheels which rotates with help of six DC motors. It allows to climb to low and middle zone fast enough.
2. We decided to use the lift in our robot. It help us to score elements to high goal from low or middle zone. So we don't need climb to the high zone. We choosed the construction with inclined retracktable construction profiles because it is the most simple and reliable.
3. The robot will collect elements with help of rotating brush which pull them to the special bucket which connected with the lift. This method is the most simple and fast. After collecting elements the bucket rises by the lift. Then it overturns to the side and elements fall to the box.
4. We decided to make one mechanism for scoring autonomous climbers and pushing the button. It is the F-shaped beam. In the top beam is the bucket for climbers, in the bottom - axle which push button. When we turn this mechanism the axle push the button and in the same time climbers fall to the goal.
5. For scoring climbers in tele op we decided to use horizontal retracktable slat that move to the both sides by the wheel that rotate with help of servo of continuous rotation. When the slat extract it push to the hook that fix zip line.
6. The pulling mechanism is the 2 DC motors that reel the rope which connected with the hook that fixed on the lift. Also this motors rise the lift. When lift is rising the rope is extracting. When the robot pull up rope is reeling and lift is lowering.
7. For pushing clear signal we decided use the servo with beam that fixed on the lift.

1 Thanks and prospects

We enjoyed working on a custom and non-standard project, which, besides its technical aspect, included working with new people who shared our values of friendship and mutual understanding.

Our team is planning to continue doing robotics, setting new goals for ourselves in order to improve. This is our first year taking part in FTC and we will participate next year as well. If we don't realize ourselves this year, we'll look at all our mistakes, correct them, and perform a lot better next year.

In any case, we are ready to learn new things, improve ourselves and expand our skills.

None of us know for sure what we want to do in the future, but we are certain that our experience will be very valuable to us.

Our thanks go to the company FIRST for organizing this competition, which we are very happy to be participating in. We appreciate this wonderful opportunity to test ourselves and learn something new and wish them success and growth in their future endeavors.

Also we thank our sponsors: company PTC and its Russian representative "Irisoft" and charitable foundation "Finist" for their support. Also we thank Physics-Mathematics Lyceum 30 and its director Alexey Tretyakov for providing comfortable conditions for preparation to competition.

Team PML 30 φ
